

Maximize your energy and stay healthy

If you're feeling less than energetic, you may not need to look any farther than your eating habits. How and what you eat, among other factors, determines how energetic you feel. Being dehydrated, going too long between meals or eating the wrong combination of foods may all drain your energy reserves.

Here are some tips to ensure you're eating properly to maximize your energy levels:

Breakfast is the most important meal of the day. Having a proper breakfast has many advantages. Breakfast-eaters tend to have higher metabolisms, fewer cravings, eat less at night, and have higher intakes

of vitamin C and iron. Breakfast can also improve concentration. Try to eat within one to two hours of getting up each morning.

Here are some quick and healthy breakfast ideas:

- Cereal with milk and fruit
- Whole-wheat toast with peanut butter and fruit
- Cottage cheese with fruit and bagel
- Bagel with cheese and tomato
- Egg with English muffin and fruit

The right combination. For each meal, choose food from three out of the four food groups in Canada's Food Guide. This is a good rule of thumb to ensure that you are eating balanced meals that include carbohydrates (such as whole-grain breads, pasta, brown rice, beans, peas, lentils, potatoes, crackers, higher fibre cereals and fruits) and protein (such as lean meat, pork, veal, fish, poultry, eggs, cheese, beans, peas/lentils, tofu, nuts, seeds and peanut butter). A balanced meal should satisfy you for about three to six hours. If you include protein and a little fat with meals, this will help to control your appetite and hold you over even longer before hunger returns.

Timing is everything. Eat regularly, every three to six hours when hungry. Plan healthy snacks for between meals to keep you feeling full and satisfied. Sweets or caffeine on an empty stomach can send your blood sugar on a roller coaster ride, giving you immediate energy followed by a feeling of low energy.

Feed your need for energy with healthy snacks. Carbohydrates usually satisfy your appetite for about two hours. They are ideal as snacks to hold you over until a meal. Here are some suggested carbohydrate snacks:

- Low-fat crackers and cookies
- Cereals that don't need milk
- Homemade trail mix (pretzels, cereal, dried fruit)
- Fruit or diluted fruit juice
- Muffins (small, low-fat ones)
- Popcorn (light microwave or air popped)

For an extra nutritional bite, here are some ways to combine protein with your carbs at snack time:

- Chocolate milk
- Veggies and hummus
- Cheese or cheese string and low-fat crackers
- Dried cereal and raisins
- Low-fat muffin and slice of cheese
- Yogurt with nuts/seeds or high fibre cereal

Make lunch a high-energy meal. Here are some easy lunch ideas that combine both protein and carbs to provide you with longer-lasting energy:

- Sandwiches/subs—turkey, chicken, lean ham
- Broth-based soups—vegetable, split pea, bean, barley
- Stir fry—shrimp, chicken with steamed rice
- Vegetarian pizza
- Pasta with tomato sauce
- Bean burrito
- Hummus in pita
- Teriyaki dishes made with little oil

Keep hydrated. Water is involved in almost every process in the body. If you're not getting enough, your performance will most likely suffer. Signs of dehydration include fatigue, headaches, dizziness, and dark urine. Signs that you're well hydrated include light-coloured or clear urine and going to the washroom frequently.

Keep yourself hydrated with water, juice, milk, non-caffeinated herbal teas, and other non-caffeinated, non-alcoholic beverages. Six to eight glasses of water a day is recommended; keep a thermos jug at your desk or in the fridge and add lime, lemon or cucumber slices for a refreshing glass anytime.

If your energy levels are slipping, consider the healthy eating and hydration tips outlined in this article. Your doctor or registered dietician will be able to provide you with a more detailed plan, catered to your specific needs.
